**Numerical Techniques in Electromagnetics, Second Edition** Nov 07 2020 As the availability of powerful computer resources has grown over the last three decades, the art of computation of electromagnetic (EM) problems has also grown - exponentially. Despite this dramatic growth, however, the EM community lacked a comprehensive text on the computational techniques used to solve EM problems. The first edition of Numerical Techniques in Electromagnetics filled that gap and became the reference of choice for thousands of engineers, researchers, and students. The Second Edition of this bestselling text reflects the continuing increase in awareness and use of numerical techniques and incorporates advances and refinements made in recent years. Most notable among these are the improvements made to the standard algorithm for the finite difference time domain (FDTD) method and treatment of absorbing boundary conditions in FDTD, finite element, and transmission-line-matrix methods. The author also added a chapter on the method of lines. Numerical Techniques in Electromagnetics continues to teach readers how to pose, numerically analyze, and solve EM problems, give them the ability to expand their problem-solving skills using a variety of methods, and prepare them for research in electromagnetism. Now the Second Edition goes even further toward providing a comprehensive resource that addresses all of the most useful computation methods for EM problems.

***The Biopsychosocial Model of Health and Disease*** Apr 12 2021 This open access book is a systematic update of the philosophical and scientific foundations of the biopsychosocial model of health, disease and healthcare. First proposed by George Engel 40 years ago, the Biopsychosocial Model is much cited in healthcare settings worldwide, but has been increasingly criticised for being vague, lacking in content, and in need of reworking in the light of recent developments. The book confronts the rapid changes to psychological science, neuroscience, healthcare, and philosophy that have occurred since the model was first proposed and addresses key issues such as the model's scientific basis, clinical utility, and philosophical coherence. The authors conceptualise biology and the psychosocial as in the same ontological space, interlinked by systems of communication-based regulatory control which constitute a new kind of causation. These are distinguished from physical and chemical laws, most clearly because they can break down, thus providing the basis for difference between health and disease. This work offers an urgent update to the model's scientific and philosophical foundations, providing a new and coherent account of causal interactions between the biological, the psychological and social.

***Application of Analytical Chemistry to Foods and Food Technology*** Sep 05 2020 The application of analytical chemistry to the food sector allows the determination of the chemical composition of foods and the properties of their constituents, contributing to the definition of their nutritional and commodity value. Furthermore, it is possible to study the chemical modifications that food constituents undergo as a result of the treatments they undergo (food technology). Food analysis, therefore, allows us not only to determine the quality of a product or its nutritional value, but also to reveal adulterations and identify the presence of xenobiotic substances potentially harmful to human health. Furthermore, some foods, especially those of plant origin, contain numerous substances with beneficial effects on health. While these functional compounds can be obtained from a correct diet, they can also be extracted from food matrices for the formulation of nutraceutical products or added to foods by technological or biotechnological means for the production of functional foods. On the other hand, the enormous growth of the food industry over the last 50 years has broadened the field of application of analytical chemistry to encompass not only food but also food technology, which is fundamental for increasing the production of all types of food.

***Traité d'ostéopathie*** Dec 29 2019 Véritable bible de l'ostéopathie, cet ouvrage permet à la pratique de renouer avec des champs de compétences parfois oubliés et participe à ouvrir la voie de la communication interdisciplinaire.

***Edible Insects*** Oct 19 2021 Edible insects have always been a part of human diets, but in some societies there remains a degree of disdain and disgust for their consumption. Insects offer a significant opportunity to merge traditional knowledge and modern science to improve human food security worldwide. This publication describes the contribution of insects to food security and examines future prospects for raising insects at a commercial scale to improve food and feed production, diversify diets, and support livelihoods in both developing and developed countries. Edible insects are a promising alternative to the conventional production of meat, either for direct human consumption or for indirect use as feedstock. This publication will boost awareness of the many valuable roles that insects play in sustaining nature and human life, and it will stimulate debate on the expansion of the use of insects as food and feed.

***Calf and Heifer Feeding and management*** Nov 19 2021 From birth to first calving, the replacement heifer undergoes tremendous changes anatomically as well as in feeding and management practices. The calf changes from being a pseudo-monogastric to a full ruminant within a period of two months. During the same period, the calf is fed colostrum, milk, or milk replacer, and starter with or without hay. Notably, the lifetime milk production and health of a dairy cow is highly dependent on early life nutrition and management of the calf and, subsequently, the heifer. Hence, animal scientists continue to investigate critical areas such as colostrum feeding, the level of liquid feeding,

gut microbial succession, energy and protein levels, housing, health management, and their interactions with the animal in an effort to help dairy producers raise successful and sustainable dairy enterprises.

**An Introduction to Population-Level Prevention of Non-Communicable Diseases** May 02 2020 Non-communicable diseases (NCDs) are the single biggest cause of death in the world. They include cardiovascular diseases, such as heart attacks and stroke, cancers, chronic respiratory diseases, like chronic obstructed pulmonary disease and asthma, and diabetes. The World Health Organization published a 'Global Action Plan for the prevention and control of NCDs 2013-2020' which set a target to reduce death rates from NCDs by 25%. In response, countries are drawing up national level NCD prevention policies and programmes. New units have been set by governments, NGOs, and other organisation to drive this agenda forward creating a need for capacity building and training. Until the Nuffield Department for Population Health at the University of Oxford initiated an accredited six-day short course on Prevention Strategies for Non-Communicable Diseases with a population-based approach, many attempts to engage with NCD prevention centred on individual-level interventions, such as screening and treating individual patients. In this new book, the course leaders bring together the entire scope of the population-based approach and provide a solid introduction to the concepts, evidence, and methods that define it. 'An Introduction to Population-Level Prevention of Non-Communicable Diseases' takes readers through the policy cycle from problem definition, solution generation, capacity building, and implementation to evaluation and monitoring. The book includes a wide range of case studies, and practical examples of plans and projects which illustrate real-life application of theory. This book provides an unparalleled overview of population-based approaches to the prevention of non-communicable diseases, reflecting the latest research in the field. It will be a key resource for anyone with an interest in NCD prevention, with particular relevance to early-career professionals working on NCD prevention in governments, NGOs, health care institutions, and universities, as they develop the knowledge and skills required for effective population-based prevention strategies.
